

PRD for Daily AI News Dashboard (name work in progress)

Version History

Timeline:

- 1/20: Version 1.0 - Doc Created

Related Documents/Links

Potential Project Starting Point #5: “As language models become capable of high-level reasoning and summarization, many components of public policy monitoring and impact analysis can be automated.”

Key Benchmarks

Existing products and resources include the downloadable [UiPath 2026 AI and Agentic Automation Trends Report](#), as well as online sites such as AI News, TechCrunch: [AI News & Artificial Intelligence | TechCrunch](#), and AINEWS: [AI News](#). While websites specific to AI News exist, they do not provide an all-encompassing *tool* for users to get actionable insights into what they can start using **today** to augment their daily tasks and performance. Our app would not only provide updates to users on AI policy, model releases, and technical developments, but would also personalize AI usage recommendations based on users’ interests, hobbies, needs, and professions.

Research

There is a strong call for transparency around AI: [Closing Information Gaps via AI Transparency](#) (Diakopoulos, 2026). Our app would help increase awareness of technological developments. Further, individuals’ AI capabilities differ, leading to gaps in success among workers and across countries. [The Hidden Multiplier: Unraveling the True Cost of the Global AI Skills Gap - IEEE Technology and Society](#) (Lin, 2025) explores how “AI skill gaps act as a power multiplier, which creates an ‘AI oligarchy.’” The development and benefits of AI are concentrated in the hands of a few nations and corporations, thus fundamentally reshaping global order and human progress.” Our product advances understanding of AI tool use cases, expanding their availability to all.

Articles

There is a large gap in AI knowledge: [The AI knowledge gap challenge](#) (Rowe, 2025): “17% of workers are using AI tools daily, 27% never do, and less than half have training or education on the technology”. Businesses need to understand how to use AI tools in order to succeed against

competitors: [The AI Knowledge Gap - The One Skill That Will Set Business Professionals Apart](#) (Hanegan, 2025).

Related Software/Technology

[LetMeKnow.news](#) is a mobile app that provides general, AI-curated, and AI-summarized news digests. The user can follow specific channels and topics (e.g., tech, sports, politics, CNN, Fox), subscribe to local news, and view a recommended feed that takes into account the user's settings and past viewing preferences. Instead of articles, the feed is organized by topic in the category (e.g., OpenAI faces copyright lawsuits), with key points for each topic and relevant articles for each key point. Additional features include showing bias labels (left, center, right), offering filters by political bias, and discussions, polls, and voting with other users. This app, listed on the App Store and Google Play, is primarily consumer-facing

[Read.ai](#) is an AI-powered productivity platform. Its primary feature is an AI meeting assistant and notetaker that transcribes conversations and generates summaries. It's relevant to our project because it also has a Search Copilot feature that lets users search across meetings, emails, chats, docs, and integrated tools like Gmail, Outlook, Slack, Notion, CRM systems, and provides a unified summary. It is marketed as an enterprise-facing application to boost workplace productivity.

Overview

The **mission** of our project is to clear the air around AI news, producing easy-to-understand summaries of AI developments. Using AI, updates are monitored, and information is autonomously synthesized for users. Our **vision** is to accelerate tracking of the fast-changing field of artificial intelligence, exploring how increasingly powerful LLMs can facilitate global understanding, knowledge, transparency, and the use of AI. Regarding Starting Point 5, the product addresses the insight into using AI for policy and news understanding.

Our product seeks to address the information gap around AI updates. People usually have to go between various news sources and apps to read the necessary news, learn about tools they could start using, and understand the policies around AI use and transparency. Our LLM-powered hub is a tool that quickly summarizes and combines all of these information sources to help users understand what is going on and stay informed.

Problem/Benefit

Problem: We are trying to address the significant challenge of keeping up with the daily influx of complex information on AI policies, technology updates, and AI use cases. There is a knowledge gap between those involved in the field and educated on AI and those who are not. To address this gap and its potential social and economic implications, our product aims to provide meaningful information

that is easy to comprehend and use. It takes time to fully learn AI, understand the politics around its use, and become a member of, or at least partially involved in, the AI revolution, rather than just someone who hears about it.

Benefit: The product summarizes and combines information across platforms, such as Twitter, news feeds, and hyperscaler websites. Users don't have to do the extra work of deciphering complex technical information; the AI-powered platform does it for them in one place. Moreover, by completing a personalized form upon downloading the app, the platform personalizes the trends and tools shared to the user's interests and needs.

Opportunity

Identify some opportunities for your product.

What are the opportunities to have an impact in your project about which you are most passionate?
What are realistic targets for those opportunities that would be fulfilling if you achieved them by June?
How niche or how big is the Total Addressable Market (TAM)?

Opportunity

With AI's fast-paced growth in today's market, both individuals and organizations need to track developments in this sector and how it might impact their work. This includes new models, policy changes, and general commentary on the future of AI. A clear opportunity exists to use AI itself to reduce information overload and synthesize what AI news is most pertinent or relevant to a given user.

Impact Opportunities

- Enable students and early-career professionals to stay up-to-date on AI news without having to spend hours across social media, news, and other entertainment platforms
- Enable practitioners and teams to identify emerging tools and trends earlier
- Explore the ability of LLMs to automate high-level monitoring tasks in non-static domains

Near-Term Targets (by March):

- Deliver a functional MVP that aggregates AI content from multiple sources (e.g. Instagram, the New York Times, LinkedIn, etc.)
- Provide clear summaries and topic groupings that reduce search effort (e.g. relevant tags or 1 sentence overviews)
- Validate usefulness with a small, focused user group (e.g. students or AI-interested professionals)

Market Opportunity

The initial target market is students and professionals who work adjacent to AI—a potential expansion could be enterprises that generally need to monitor AI developments. While the long-term Total

Addressable Market is large, this project narrows the scope to a high-need segment where information overload is most acute.

User segments

Who are you building your product for?

If you have user/customer segments who need certain types of functionality, list them here. User personas/journeys could be described here. Use cases could be another way to think of this as well.

What use cases are you going to nail?

The product is designed for users who need to stay informed about AI but lack the time or bandwidth to manually monitor multiple sources.

The **primary user segment** is students studying computer science, engineering, or adjacent fields, who may also be starting careers in technology and AI. The core use case is to quickly understand what is happening in AI this week and identify topics worth exploring further.

The user persona is a college junior who has an interview for a dream role at an AI startup tomorrow, but also has to deal with coursework from multiple demanding core classes and electives. For the interview, the student is expected to be responsible for a **high-level understanding of current AI developments** and **awareness of emerging tools and trends** for the interview, but they are also tight on time, thus unwilling to comb through multiple sources to gain that understanding. They need **succinct and clear summaries of the most relevant AI topics without needing deep prior expertise to comprehend**.

The **secondary user segment** is AI practitioners and technical professionals, such as engineers, researchers, and product managers working on technology and AI-related products. The core use case is to stay up to date on relevant AI developments without disrupting day-to-day workflow.

The user persona is an engineer in their 30s working at an AI lab. Work itself is already demanding, and the responsibility of a growing family is quickly piling up on top of countless intern pull requests, on-calls, and workplace politics. With the little energy the engineer is able to gather, the last thing they want to do is scroll through news sources and deep dive into new papers to understand new trends in AI. They need a way to **efficiently monitor tech tools, frameworks, and industry trends, reduce time spent scanning social media and news, and receive accurately early signaling on emerging approaches**.

The use cases we need to nail are:

- Weekly or daily AI summaries across news and social media platforms
- Topic-based views (e.g., models, tooling, applications)
- Easy access to original sources (eg. news articles, Substack posts, academic papers) for deeper reading

Value Prop / Differentiators

Think about this from the standpoint of your key features/benefits. Again, you are encouraged to look at the “[Messaging Activation Matrix](#)” and imagine things that you’ll need to have a compelling product relative to what’s out there now.

There should be at least 3 features/benefits you can highlight in your messaging about your product

What is the value prop of your product?

How is this product better than competitor products?

How is this product better than what people are using now?

What are the three most compelling features that will be front and center on press releases, home pages, product packaging, etc.

Value Proposition: The product provides a single intelligent view of the current state of the AI ecosystem, replacing fragmented manual tracking with automated synthesis. Users spend less time searching for information and can rely on a specialized source to stay up-to-date on everything AI.

Differentiators:

Our product is way better than manual workflows. Users currently rely on Twitter/X, LinkedIn, newsletters, and news sites, requiring constant tab-switching and self-synthesis. This product centralizes and structures that information automatically.

Our product has an advantage over existing news aggregators because, instead of acting as a curator that lists articles chronologically or aiming to summarize many different topics (eg. politics, sports), our product summarizes, clusters, and contextualizes information and specializes in AI topics, helping users understand trends rather than just consume links.

Our product also stands out against AI newsletters since newsletters are static, un-customized, and come at fixed intervals. Users using our product can access their personalized feed of AI information on-demand.

Key Features:

- **Cross-Platform Content Aggregation:** Aggregates AI-related content from multiple sources (news, social media, blogs, tool announcements) into one unified view.
- **Automated Summarization & Article Clustering by Topic:** Uses LLMs to summarize key developments with bullet points and group articles under relevant developments instead of a chronological list. This makes trends and narratives easy to follow and digest.
- **Interest-Based Filtering:** Surfaces updates that best align with user interests to the top, reducing noise and information overload.

Messaging Takeaway

This product is not just about more information — it is about clarity, prioritization, and insight in a fast-moving domain.

Functional Requirements

Functionality	User Segment 1	User Segment 2	User Story	Priority
Feature 1: Cross Platform Content Aggregation	Yes	Yes	As a user, I want AI-related content from multiple platforms in one place so I don't have to manually check many sources.	Must have
Feature 2: Automated Summaries	Yes	Yes	As a user, I want concise summaries so I can quickly understand what's happening without reading full articles or threads.	Must have
Feature 3: Interest-Based Filtering	Yes	Yes	As a user, I want to filter content by my interests so I only see what's relevant to me.	Nice to have

Feature 1: Cross-Platform Content Aggregation

- Description: The product aggregates AI-related content from multiple sources into a single dashboard.
- Problem Solved: AI information is fragmented across platforms, forcing students and professionals to manually monitor developments. This feature eliminates the need for manual tracking and is the core value add of our product.
- Why It's Important: Aggregation is foundational — without it, summarization and trend analysis are not possible.
- How It Works: The system periodically collects AI-related content from a predefined set of sources and normalizes it into a consistent internal format.
- Priority / Timing: Must-have. Implemented in the earliest MVP.

Feature 1.1: (INTERNAL DISCUSSION) Source Selection & Scope

Defines which platforms are included (e.g., news sites, blogs, selected social media accounts) and limits scope to AI-relevant content. The team will likely decide on a set of sources to include in an MVP and then possibly offer choice/additional websites if it becomes relevant.

Feature 1.2: De-duplication

Create either a filter or an AI categorizer that identifies and removes near-duplicate content across sources to avoid repetition. Again, this is a bit more of a nice to have on top of the most important feature.

Feature 2: Automated Summarization

- Description: Uses large language models to generate concise summaries of many individual pieces of content.
- Problem Solved: Users lack time to read long articles or threads. Summaries allow them to quickly understand key points.
- Why It's Important: Specific summarization is the primary time-saving mechanism and core user-facing value.
- How It Works: From all of the sources, each ingested item is passed through an LLM (likely, although we're exploring other ideas as well) to generate a short, structured summary.
- Priority / Timing: Must-have. Delivered alongside Feature 1.

Feature 2.1: Personalized Key Point Extraction

Highlights the most important ideas or announcements within a piece of content. Knowing what the user is interested in, we'd like to be able to summarize recent LinkedIn/blog/other posts with an eye to their specific interests. This might take the form of a survey at the beginning of the login process that then looks for those keywords in the articles, or specific prompting to the LLM that is used.

Idea: different user segments having different needs/use cases?

Feature 3: Interest-Based Filtering

- Description: Overall, in each area, we'd like to allow users to filter content based on selected AI topics or categories. While individual features will have interest based filtering if time allows, we'd also like to highlight the individualized component of the app as a whole.
- Problem Solved / For Whom: Users have different interests and don't want to see irrelevant content.
- Why It's Important: Reduces noise and increases perceived relevance.
- How It Works: Users select interests which influence content ranking and visibility. Specific ideas are mentioned earlier and will depend on the exact feature being personalized.
- Priority / Timing: Should-have. Implemented after technology is up and running.

Complete above this line for the initial PRD revision due in the first part of the course. Below the line you should fill out as your product and plan evolves and have in a fully completed state by the end of the course

Go to Market Plan

A lot of activity happens during development to define your product. Building a great product doesn't mean users will discover and use it. Identify all the messaging mediums you will use and the content you will communicate through them.

How will you educate users about your product? How will you learn from them?

How do you plan to launch this feature with your target users?

How will users learn how to use it?

Link or embed your [Messaging Activation Matrix](#)

Metrics for success

This section is used to identify important metrics to measure product performance. How do you measure success and adoption for the product? These can be internal or external metrics, adoption metrics, performance metrics, logging, survey data, and more. List concrete metrics to track here.

Objective Function

What is the objective function? What do you want your product to achieve and how will you measure it? Be clear about what the objective is and how that is measured.

Goals

What numbers do you aim for? What would be initial targets? What is successful? What is aspirational?

Timeline

Major milestones

Design considerations

Any high level UX/UI considerations to mention, but primarily link to any UX research or any prototypes as things progress.

Technical considerations

Anything that's relevant for/from engineering, such as key technical challenges or risks. Platforms supported.

Are there any product assumptions/features that impact engineering design/cost? One very core example is in what medium does the product need to be delivered? Mobile (iOS, Android, both?), Web, custom hardware, commodity hardware, etc.

Open questions (optional)

Log any open questions here that you have. For example:

- What decisions still need to be made?
- What research still needs to be conducted?
- What does product user/market fit look like?
- What is the MVP?
- What are you trying to learn in each phase?
